  - Casting
- Abstract Classes

CSLAB

# ● Introduction to Polymorphism

- There are three main programming mechanisms that constitute Object Oriented Programming (OOP)
  - Encapsulation: *{ combining data and actions into a single unit (Class) }*
  - Inheritance: *{ deriving information and functionality from base or super class }*
  - Polymorphism
    - What is Polymorphism?
- Comes from 2 Greek words
  - poly (many)
  - morph (forms, shapes)

CSLAB

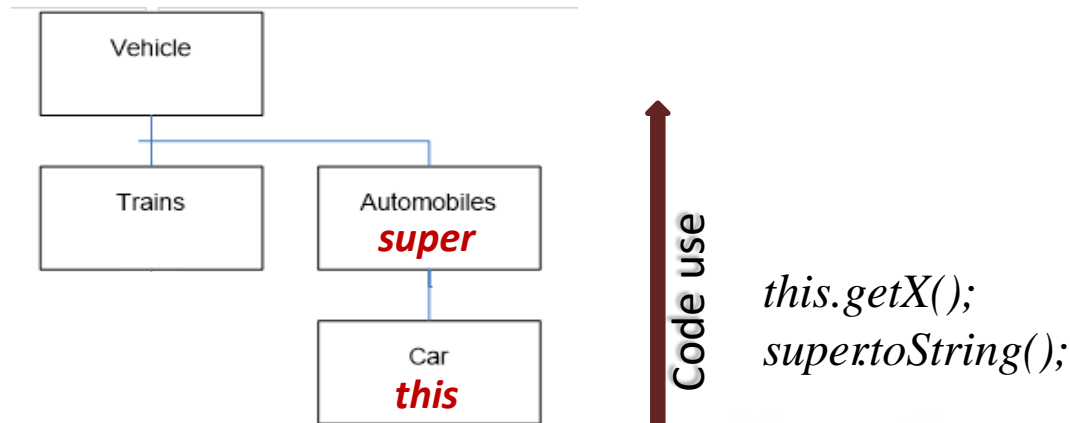

## ● Introduction to Polymorphism (Contd)

- Polymorphism is the ability to associate many meanings to one method name by means of a late binding mechanism
  - It does this through a special mechanism known as *late binding* or *dynamic binding*

CSLAB

## ● Introduction to Polymorphism (Contd)

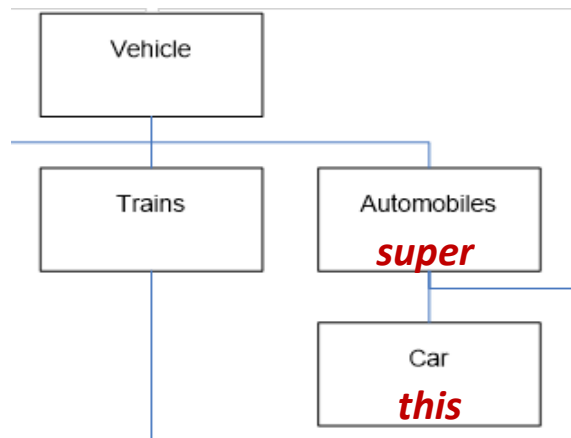

- Inheritance allows a base class to be defined, and other classes derived from it
  - Code for the base class can then be used for its own objects, as well as objects of any derived classes

CSLAB

## ● Introduction to Polymorphism (Contd)

- Polymorphism allows changes to be made to method definitions in the derived classes, and have those changes apply to the software written for the base class

```
public class Automobile{  
    ---  
    public String toString(){  
        ---  
    }  
}  
  
public class Car{  
    ---  
    public String toString(){  
        ---  
    }  
}
```

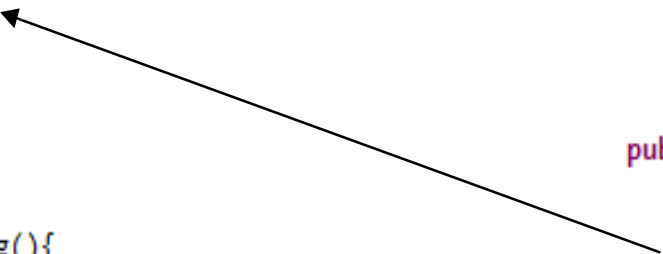

CSLAB

# ● Binding

- The process of associating a method definition with a method invocation is called *binding*

```
public class Automobile{  
    ---  
    public String toString(){  
        ---  
    }  
}  
  
public class Car{  
    ---  
    public String toString(){  
        ---  
    }  
}
```

public static void main (String[] args){  
  
 Automobile auto = new Automobile();  
 System.out.println(auto.toString());  
}

A black arrow originates from the `toString()` method call within the `main` method of the `Car` class and points to the `toString()` method definition within the `Automobile` class, illustrating the binding process.

CSLAB

# ● Binding

- If the method definition is associated with its invocation when the code is **compiled**, that is called *early binding* or *static binding*
- If the method definition is associated with its invocation when the method is invoked (**at run-time**), that is called *late binding* or *dynamic binding*
- Java uses *late binding* for all methods
  - Except for a few cases discussed later

CSLAB

## ● Self-Test (1)

### • Sale 클래스에 다음 메소드를 작성할 것

- 두 객체의 name과 bill()이 동일할 경우 true를 반환하는 equalDeals(Sale otherSale) 메소드를 작성할 것
- 호출한 객체의 bill()이 인자의 bill()보다 작을 경우 true를 반환하는 lessThan(Sale otherSale) 메소드를 작성할 것

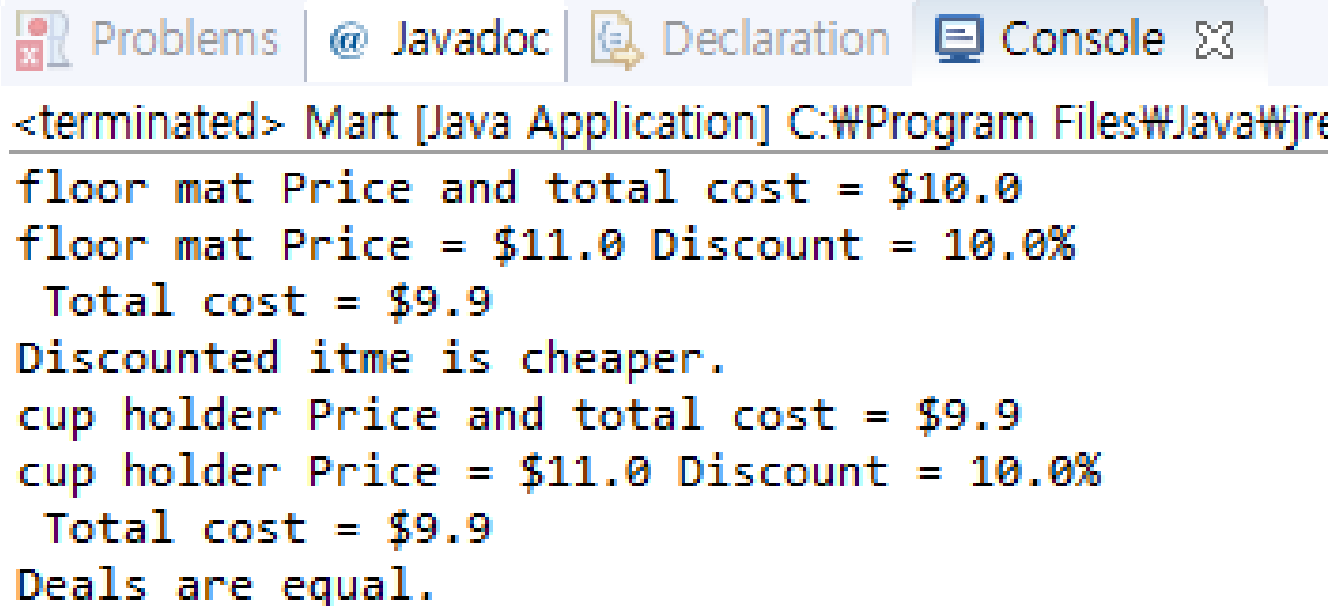

### • DiscountSale 클래스에 다음 메소드를 작성할 것

- Sale 클래스의 bill() 메소드를 DiscountSale 클래스의 할인율(discount)이 적용된 값을 반환하는 bill() 메소드로 override 할 것
  - discount 값은 %(percentage)이다.
- 두 객체의 name, bill, discount가 동일할 경우 true를 반환하는 equals(Object obj)를 작성할 것

CSLAB

## ● Self-Test (1) (Contd)

- Mart 클래스의 main 메소드를 수행했을 때 다음과 같이 출력되어야 함

The screenshot shows an IDE window with a tab labeled 'Console'. The output text is as follows:

```
<terminated> Mart [Java Application] C:\Program Files\Java\jre
floor mat Price and total cost = $10.0
floor mat Price = $11.0 Discount = 10.0%
  Total cost = $9.9
Discounted itme is cheaper.
cup holder Price and total cost = $9.9
cup holder Price = $11.0 Discount = 10.0%
  Total cost = $9.9
Deals are equal.
```

CSLAB

# ● No Late Binding for Static Methods

- When the decision of which definition of a method to use is made at compile time, that is called *static binding*
  - This decision is made based on the *type of the variable naming the object*
- Java uses static, not late binding with *private*, *final*, and static methods
  - In the case of *private* and *final* methods, late binding would serve no purpose
  - However, in the case of a static method invoked using a calling object, it does make a difference

CSLAB

## • The *final* Modifier

- A *method* marked *final* indicates that it cannot be overridden with a new definition in a derived class
  - If *final*, the compiler can use early binding with the method

*public final void someMethod() { ... }*

- A *class* marked *final* indicates that it cannot be used as a base class from which to derive any other classes

CSLAB

# ● Upcasting and Downcasting

- *Upcasting* is when an object of a derived class is assigned to a variable of a base class (or any ancestor class)
- *Downcasting* is when a type case is performed from a base class to a derived class (or from any ancestor class to any descendent class)
  - *Downcasting* has to be done very carefully
  - In many cases it doesn't make sense, or is illegal

CSLAB

## ● Upcasting and Downcasting (Contd)

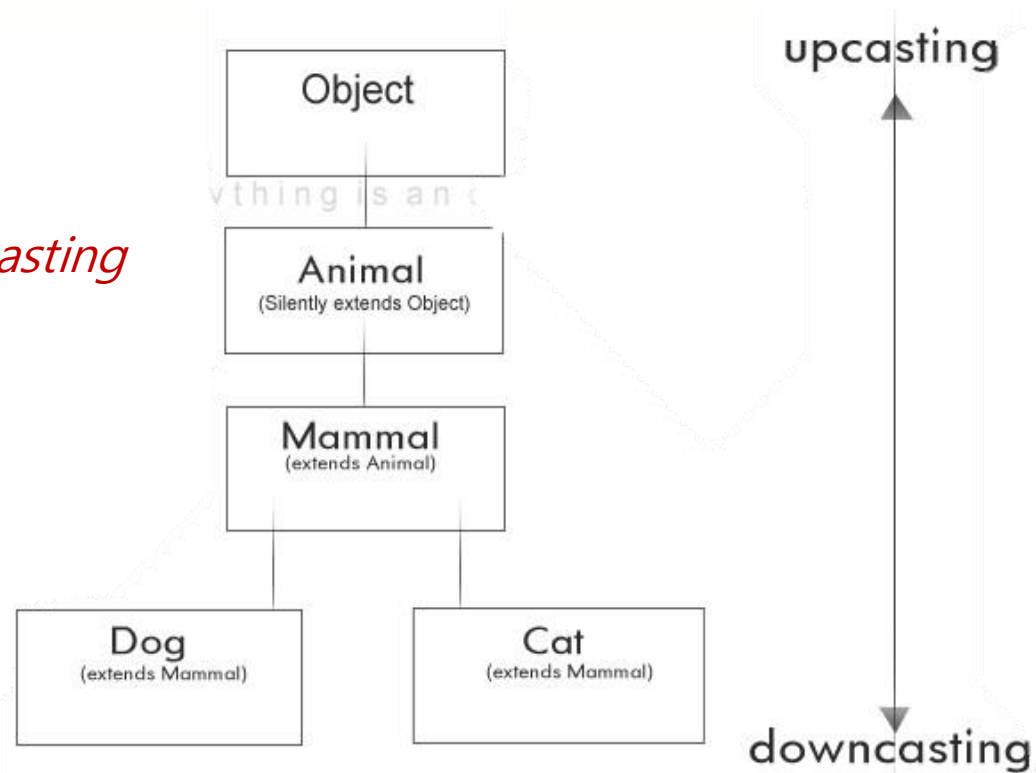

- *Downcasting* makes sense only if the object to be cast is an *instanceOf* the class type

```
if(myObject instanceof ClassType) {  
    ClassType classObject = (ClassType) myObject;  
    // now you can use classObject form here  
}
```

CSLAB

# Upcasting and Downcasting (Contd)

```
Cat c = new Cat();  
Mammal m = c; // upcasting
```

```
Cat c1 = new Cat();  
Animal a = c1; // automatic upcasting to Animal  
Cat c2 = (Cat) a; // manual downcasting back to a Cat
```

CSLAB

## ● A First Look at the *clone* Method

- Every object inherits a method name *clone* from the class *Object*
  - The method *clone* has no parameters
  - It is supposed to return a deep copy of the calling object
- However, the inherited version of the method was not designed to be used as is
  - Instead, each class is expected to override it with a more appropriate version

CSLAB

## • Simple *clone* Method

- We can define a simple clone method by using the copy constructor

```
public ClassType clone() {  
    return new ClassType(this)  
}
```

- This is a **very simple** clone method, however more checks should be done before cloning
  - We do not cover this until Chapter 13

CSLAB

## ● Example

```
import java.util.GregorianCalendar;

public class ObjectDemo {

    public static void main(String[] args) {

        // create a gregorian calendar, which is an object
        GregorianCalendar cal = new GregorianCalendar();

        // clone object cal into object y
        GregorianCalendar y = (GregorianCalendar) cal.clone();

        // print both cal and y
        System.out.println("" + cal.getTime());
        System.out.println("" + y.getTime());

    }
}
```

```
Mon Sep 17 04:51:41 EEST 2012
Mon Sep 17 04:51:41 EEST 2012
```

# ● Abstract Classes

- Some classes may be defined with incomplete methods definitions (**abstract methods**).
- Such classes are said to be **abstract**
- Such classes cannot be instantiated but must be extended by a concrete class
- **The concrete class must implement all abstract methods**
  - If all abstract methods cannot be implemented then the class must also be marked as abstract

CSLAB

# ● Abstract Classes (Contd)

## • Definitions

- An **abstract class** is a class that contains one or more abstract methods and therefore cannot be instantiated
- Abstract methods are methods that without complete definitions. instead, they are simple placeholders
- A **concrete class** is a class that contains no abstract methods and therefore can be instantiated

CSLAB

## ● Tip: An Abstract Class Is a Type

- Although an object of an abstract class cannot be created, it is perfectly fine to have a parameter of an abstract class type
  - This makes it possible to plug in an object of any its descendent classes
- It even make sense to have a variable of an abstract class type, although it can only name objects of its concrete descendent classes

CSLAB

# ● Defining Abstract Class

- Defining an abstract class is simple

```
public abstract class Myclass {  
    // class constructors  
    // accessors and mutators  
    // other methods  
  
    public abstract returnType myMethod();  
}
```

Abstract class header  
Common fields and methods  
Abstract Methods

- When defining an abstract method only specify the header

```
public abstract returnType myMethod();
```

CSLAB

## ● When to use

- Consider using abstract classes if any of these statements apply to your situation:
  - You want to **share code** among several **closely related classes**
  - You expect that classes that extend your abstract class have **many common methods** or **fields**, or require access modifiers other than public (such as *protected* and *private*).
  - You **want to declare non-static or non-final fields**. This enables you to define methods that can access and modify the state of the object to which they belong

CSLAB

## ● Self-Test (2)

### • Sale 클래스에 다음 메소드를 작성할 것

- 배송 비용을 반환하는 deliverFee() 메소드를 작성
- deliverFee() 메소드는 할인율과 남은 유통기한에 따라 달라지므로 Sale 클래스에서는 abstract 메소드로 선언
- 배송 비용이 같은 지 여부를 반환하는 equalDeliverFee() 메소드 작성 (deliverFee() abstract 메소드를 사용할 것)

### • DiscountSale 클래스에 다음 메소드를 작성할 것

- 매장에서는 제품의 할인율이 낮을 경우 무료 배송을 해주는 서비스를 진행하고 있다.
- 할인율에 따라 달라지는 deliverFee() 메소드를 정의할 것
  - 할인율  $\geq 80\%$ : 배송비용 3\$
  - $30\% \leq$  할인율  $< 80\%$ : 배송비용 2\$
  - 할인율  $< 30\%$ : 배송비용 없음

CSLAB

## ● Self-Test (2) (Contd)

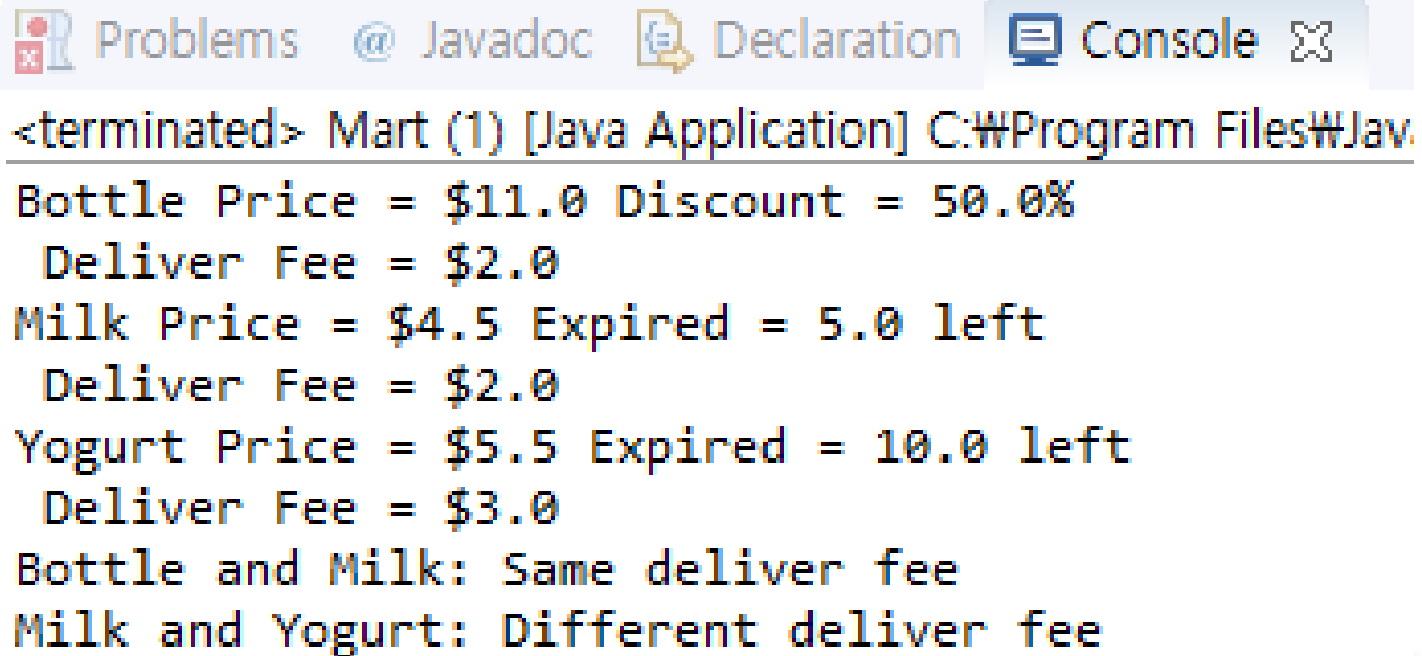

### • ExpiredSale 클래스에 다음 메소드를 작성할 것

- 매장에서는 제품의 유통기한이 얼마 남지 않았을 경우 무료 배송을 해주는 서비스를 진행하고 있다.
- 유통기한에 따라 달라지는 deliverFee() 메소드를 정의할 것
  - 유통기한  $\geq 10$ : 배송비용 3\$
  - $3 \leq$  유통기한  $< 10$ : 배송비용 2\$
  - $1 <$  유통기한  $< 3$ : 배송비용 없음
- 유통기한이 1일 이하일 경우 현장판매만 가능하므로 오류 처리

CSLAB

## ● Self-Test (2) (Contd)

- Mart 클래스의 main 메소드를 수행했을 때 다음과 같이 출력되어야 함

The screenshot shows an IDE window with tabs for Problems, Javadoc, Declaration, and Console. The Console tab is active, displaying the output of a Java application. The output is as follows:

```
<terminated> Mart (1) [Java Application] C:\Program Files\Jav.  
Bottle Price = $11.0 Discount = 50.0%  
  Deliver Fee = $2.0  
Milk Price = $4.5 Expired = 5.0 left  
  Deliver Fee = $2.0  
Yogurt Price = $5.5 Expired = 10.0 left  
  Deliver Fee = $3.0  
Bottle and Milk: Same deliver fee  
Milk and Yogurt: Different deliver fee
```

CSLAB
